Digital forensics is commonly used, for example, in computer forensics, law enforcement, government investigations, and other areas. Digital forensics also generally involves the use of computer security and/or network security information or systems and/or devices to collect and analyze data to enable the discovery of potentially pertinent or useful information. Some examples of such information include, for example, a location of a computer from which sensitive information was sent, data that a sender sent to another computer, and whether a given computer is involved in certain illegal activity. Such information may also include, for example, the type of computer to which such data was sent, data sent to such computer, and the type of data sent to such computer. Various different types of sensors or devices can be used in forensics. Examples of such sensors include hard drives, memory, network cards, optical media, hard drives, CD-ROM drives, and other devices that can be used to collect information. Some of these devices are equipped with various types of sensors, for example, hard drive sensors may have the ability to detect unique data signatures on specific portions of a disk to identify a disk or its unique serial number. Other examples of sensors include so-called "silent" devices such as a virus scanner, which may not directly read the data but may work with the data and create an image of the data at a later time. A hardware identifier of a target computer that is associated with a target hard drive provides information about the hard drive, such as the type of drive and other information. The existing systems and methods that relate to digital forensics provide some benefit for researchers and law enforcement agents. However, current systems are complex and potentially expensive, are not as efficient in their use of resources as desired, may be inefficient in their use of communication resources, are not user-friendly, may consume a large number of electricity resources, and may be slow in their operation. Further, current systems generally do not
